Not all stone material is suitable to be made into kitchenwares as they might contain harmful chemicals and might crack in contact with heat. Our quality stoneware is made from Amphibole of Jang Soo (a popular material used in Jeon Ju). Our stoneware is well-known for its high heat durability and conductivity which enable heating with no cracks in the stone.

The stone material also helps to transmit heat into the inner parts of the food so that the food can be cooked with little heat, minimizing the lost of nutrition. Each stoneware piece distributes heat efficiently which enables food to be cooked more evenly. Retaining heat within the stone, it also helps to keep the food warm when removed from fire.

Moreover, it neither reacts with acidic foods nor rust.
